

# Spinal Needle

Cat.No. 120901-120933

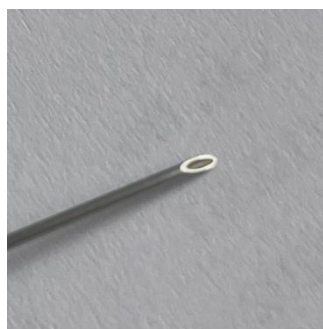

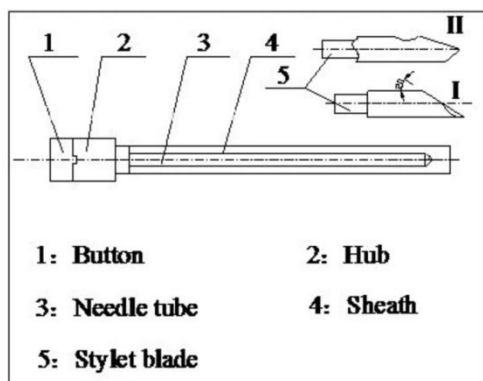

## Intended Use

The spinal needle, also known as a Lumbar Puncture Needle(LP Needle), is a type of needle used in spinal anesthesia to inject analgesia or anesthetic directly into the CSF.

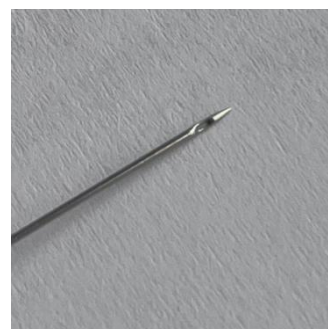

## Component

The spinal needle consists of three parts:

- Spinal needle (needle tube + needle hub)
- Stylet (stylet blade + button)
- Sheath

I . Quincke needle

II. Pencil point needle

# Spinal Needle

Cat.No. 120901-120933

## Feature

The spinal anesthesia needle is an ideal tool for performing an effective lumbar puncture with a rapid return of cerebrospinal fluid (CSF).

The sharp bevel design provides low puncture force and ensures minimal puncture trauma.

The clear polycarbonate hub of the spinal block needle offers easy visualization of CSF.

Key/slot arrangement of stylet and cannula hubs assists in proper needle bevel orientation.

Two different long spinal needles are available to meet specific clinical needs.

The Suitable shape and location of the side hole ensure enough flux and reduce the occurrence of faulty retardance.

## Specification
